Semester Project 2

Erlend Svanevik

Design

What went well on the project

Design was a pretty simple one, but ut looks good and clean. I've looked around on other shoe websited and they all have a pretty clean ui with simple colours.

I decided to try our purple for my main colour. Since I want the users to feel like the products we're selling is luxury and high quality. And white for the safety and the black for power.

What was difficult/didn't go well on the project

Designwise/layout was pretty straight foward with no probelms.

What would you do differently next time

I might have gone a little over the top with the purple, so I would change the for sure. Include more icons as well.

Technical

What went well on the project

The localstorage and toggleing of it went well, the serach for products/description went well. Admin login went well.

The stuff I've done before pretty much.

What was difficult/didn't go well on the project
The admin panel on the page I could not get to work at all, well I managed to get the DELETE request to delete products off the page, but the others I had no idea on how to get them to work. I searched high and low on how to do it. Looked at the strapi docs, but I could not figure it out. I wish we would go through it since we haven't been through it at all.

And I reused and had way too much code since I didn't make a functions for it.

Also when I use sass, I feel like I just use regular css, I make some fucntions for repeated styles like colour and margin: 0 auto.

What would you do differently next time

I would for sure fix my exports/imports and try to use/create more reusable functions. Some code was repeated too often I think.

I would also rename all function, classes, divs and attributes to more meaningfull and self explaining.

I used bootstrap for the nav and that was pretty much it, but I would get more familiar with bootstrap, I spent a little to much time on writing html and sass this time.

Summary:

The assignment went somewhat well. There are things that I know were bad and that I am really upset about that I didn't manage to figure out and how to implement. But I've made what I could figure out work but it's a little messy.
But I am happy with how the stuff I managed to figure out. I had to spend a lot of time trying to fix code that broke one day and worked the other. And I really like the design, and the pictures I found was a really nice touch and helped the website with a little pop of a lot of colours. And things work pretty much how they're supposed to, minus the edit/add funtion on the admin page.
